

DUAL 4-INPUT MULTIPLEXER

- INVERTED VERSION OF THE 54/74LS153
- SEPARATE ENABLES FOR EACH MULTIPLEXER
- INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS
- FULLY TTL AND CMOS COMPATIBLE

DESCRIPTION

The T74LS352 is a very high speed Dual 4-Input Multiplexer with Common Select inputs and individual Enable inputs for each section. It can select two bits data from the sources. The two buffered outputs present data in the inverted (complementary) form.

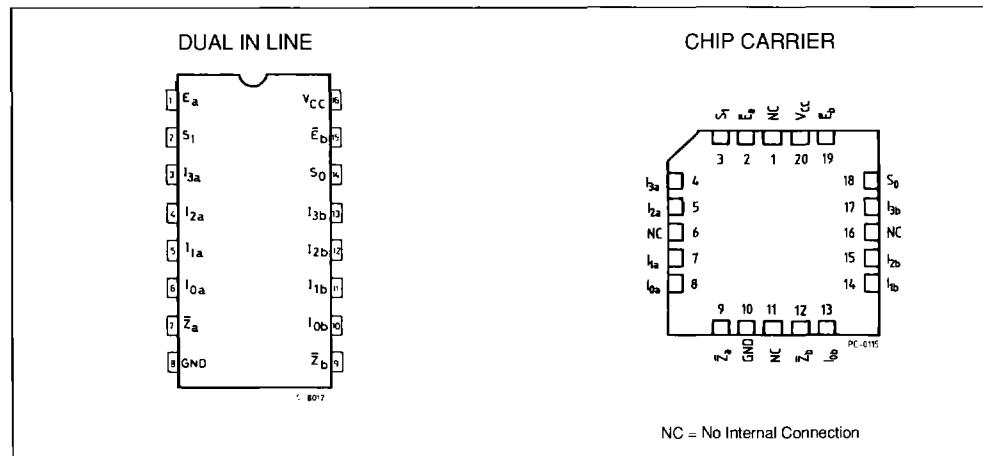

The T74LS352 is the functional equivalent of the T74LS153 except with inverted outputs.

Stresses in excess of those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions in excess of those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

FUNCTIONAL DESCRIPTION

The LS352 is a Dual 4-Input Multiplexer. It selects two bits of data from up to four sources under the control of the common Select Inputs (S_0 , S_1). The two 4-input multiplexer circuits have individual active LOW Enables (E_a , E_b) which can be used to

$$\bar{Z}_a = \bar{E}_a \cdot (\bar{I}_{0a} \cdot \bar{S}_1 \cdot \bar{S}_0 + I_{1a} \cdot \bar{S}_1 \cdot S_0 + I_{2a} \cdot S_1 \cdot \bar{S}_0 + I_{3a} \cdot S_1 \cdot S_0)$$

$$\bar{Z}_b = \bar{E}_b \cdot (\bar{I}_{0b} \cdot \bar{S}_1 \cdot \bar{S}_0 + I_{1b} \cdot \bar{S}_1 \cdot S_0 + I_{2b} \cdot S_1 \cdot \bar{S}_0 + I_{3b} \cdot S_1 \cdot S_0)$$

The LS352 can be used to move data from a group of registers to a common output bus. The particular register from which the data came would be determined by the state of the Select Inputs. A less ob-

vious application is a function generator. The LS352 can generate two functions of three variables. This is useful for implementing highly irregular random logic.

The logic equations for the outputs are shown below.

Notes : 1 Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions

2. Not more than one output should be shorted at a time.

(*) Typical values are at $V_{CC} = 5.0 \text{ V}$. $T_A = 25^\circ\text{C}$.
